

HORN DOOR / HORN GATE

The Horn Door / Horn Gate is designed to open your garage door or gate in response to an auto or truck horn. It will open your garage door or gate with honk of a single horn or it can be set to open only when it detects two or three successive honks.

This sensor is very easy to install and will run off of 9-24 volts AC/DC. It draws a small amount of power, less than .01 mA, so this sensor will work well in all solar applications.

Its use in commercial garages, bus barns, and farm gates can save time and money. No more having to purchase remotes for every vehicle. No more having an attendant to open the garage door. No more getting out of your vehicle to push a button to open the garage door, going back to your vehicle to drive in and then closing the door.

The sensor comes in an all-weather case and has adjustments for the number of honks needed to trigger the door or gate along with a sensitivity adjustable so that only vehicles in the proper proximity will open the door.
